

SQA Engineer Intern Assessment

1. Product Requirements Document

QuickBite: Food Ordering & Delivery App

QuickBite is a mobile application (iOS & Android) that connects customers with local restaurants for food ordering and delivery. This PRD covers the Cart, Checkout, Coupon, Payment, Order Tracking, and Cancellation/Refund module of the customer-facing app.

Enable customers to seamlessly browse restaurants, build a cart, apply discounts, complete payment, and track their order reducing cart abandonment and increasing average order value.

In Scope

- Cart management
- Coupon / discount engine
- Payment integration (Card, UPI, Wallet, Cash on Delivery)
- Order placement, confirmation, and tracking
- Cancellation & refund flow
- Post-delivery ratings & reviews

Out of Scope

- Restaurant partner onboarding and menu management (CMS)
- Delivery partner (rider) application
- Loyalty points program (planned Phase 2)
- Group ordering / split payment (Phase 2)
- Multi-language support (Phase 3)

Users

- Lamin Yamal, 27 - urban professional, orders lunch on weekdays, price-sensitive, actively looks for coupons.
- Lionel Messi, 34 - orders for family dinners on weekends, prefers Cash on Delivery.
- Guest User - can browse restaurants and menus without logging in.

Functional Requirements

Cart Management

FR-1: Users can add items from a restaurant's menu to the cart.

FR-2: Users can add a maximum of 20 items to the cart per order.

FR-3: The cart is restaurant specific. Adding an item from a different restaurant requires clearing the existing cart; the system shows a confirmation dialog before clearing.

FR-4: Users can modify the quantity of an item in the cart from 1 to 10.

FR-5: The cart total updates in real time as items are added, removed, or their quantity changed.

Coupons & Discounts

FR-6: Users can apply one coupon code per order at checkout.

FR-7: Coupon WELCOME50 gives 50% off, capped at 100, valid only for first time users.

FR-8: Coupon FLAT20 gives a flat 20 off on orders above 149.

FR-9: If a coupon is applied and the user removes an item, bringing the cart total below the coupon's minimum order threshold, the coupon is automatically removed and the user is notified.

FR-10: Coupons cannot be combined with one another.

FR-11: Expired coupons must not appear in the "Available Offers" list. Coupon validity must also be re-validated server side at the moment the order is placed, not only when the offer is listed.

Checkout & Order Value

FR-12: The minimum order value required to proceed to checkout is 100.

FR-13: Orders above 99 qualify for free delivery. Orders below this threshold incur a flat delivery fee of 25.

FR-14: Delivery fee, platform fee (5), and applicable taxes (5% GST) are calculated and displayed before final payment.

FR-15: The "Pay Now" button is enabled only once the cart is valid: minimum order value met, delivery address selected, and payment method chosen.

Payment

FR-16: Supported payment methods: Credit/Debit Card, UPI, QuickBite Wallet, and Cash on Delivery (COD).

FR-17: COD is not available for orders above 2,000, for fraud prevention reasons.

FR-18: If an online payment fails after the amount is deducted from the user's bank but before order confirmation is received by QuickBite servers, the system auto refunds the amount within 5-7 business days.

FR-19: The "Order Confirmed" screen is shown to the user only after successful payment AND acceptance of the order by the restaurant.

Order Tracking

FR-20: Once placed, an order moves through the following statuses: Order Placed → Restaurant Accepted → Preparing → Out for Delivery → Delivered.

FR-21: An estimated delivery time is shown at the time of order placement and should be reasonably accurate.

FR-22: Delivery is typically completed within 30-45 minutes of order placement, depending on distance.

Cancellation & Refund

FR-23: Users can cancel an order free of charge within 2 minutes of placing it.

FR-24: After 2 minutes, and before the restaurant accepts the order, cancellation is still free of charge.

FR-25: Once the restaurant has accepted and started preparing the order, cancellation is not allowed.

FR-26: Refunds for cancelled orders are processed within 5-7 business days to the original payment method.

Ratings & Reviews

FR-27: Users can rate an order (1-5 stars) and the delivery partner separately, only after the order status is "Delivered."

FR-28: Users can edit a submitted rating within 24 hours.

Non-Functional Requirements

NFR-1: The app should be fast and responsive, even during peak hours (lunch / dinner rush).

NFR-2: The system should support a large number of concurrent users during festival sales.

NFR-3: Payment data must be handled securely, in compliance with industry standards.

NFR-4: The app should work smoothly on low-end Android devices and under unstable network conditions.

NFR-5: Order status changes should reflect in near real time via push notifications.

Business Rules

BR-1: A user account is uniquely identified by mobile number; one mobile number maps to exactly one account.

BR-2: A referral bonus of 50 wallet credit is given when a referred user completes their first order of 150 or more.

BR-3: QuickBite Wallet balance cannot be withdrawn to a bank account; it can only be used toward future orders.

Assessment Instructions for Candidate

Using the PRD above, complete the following two tasks.

Task - 1

Study the PRD carefully and design a comprehensive set of test cases covering functional, negative, boundary, and edge-case scenarios. Document them in a structured Google Sheet.

Task - 2

Record a six-minute video of your self, from a SQA perspective, in which you:

- Explain the product and this module in your own words.
- Call out any ambiguities, inconsistencies, or missing information you noticed in the PRD, and how you would resolve them (e.g., who you'd ask, what you'd assume, and why).
- Demonstrate how testing activities map onto the SDLC for this feature.
- Share the video link via the channel communicated to you.

2. Web Application Testing and Bug Reporting Request

Please conduct a comprehensive functional and usability test of the following web application:

Application URL: <https://sweetshop.netlify.app/>

The objective is to identify and document as many defects, inconsistencies and usability issues as possible across the application.

Note each identified issue in a **structured bug report document** and share the document link over Google Form.

3. Bonus Question: Web Automation (Not mandatory to answer)

Using any popular web automation framework of your choice (e.g., **Selenium**, **Playwright**), automate the following scenario:

1. Navigate to <https://www.automationexercise.com/>
2. Before starting the automation project, **manually create a new user account/sign up** on the website and use the newly created credentials for the automation.
3. Set up a complete automation project using your chosen automation framework and programming language.
4. Implement the automation to:
 - Launch the website.
 - Navigate to the Login page.
 - Enter the registered email address and password.
 - Submit the login form.
 - Verify that the login was successful.

Expected Deliverables

Please submit:

1. **Complete automation source code/project (GitHub Link)**
